

MEETING REPORT

Team Name: Group 1/Food Ordering and Delivering System

Date of Meeting: 10/04/2026

Start Time: 12:20

End Time: 13:00

Meeting Location: E-012

Moderator: Arjola Sula

Recorder: Arjola Sula

Other Members Present: Erjus Allka, Arjola Sula, Xhesika Toska, Klara Hysenaj, Aurelio Hysenaj

Members Absent: Imerr Meraj, Sofia Cala

Topics Discussed: Class Diagram

The Class Diagram was presented as a structural model of the system, showing the main classes, their attributes, methods, and relationships.

It was noted that:

- The Class Diagram corresponds closely with the **ER Diagram**, as both represent the core entities and their relationships, but from different perspectives (database vs. object-oriented design).
- The diagram helps define how different parts of the system interact and ensures a clear system architecture.
- It serves as a foundation for developing other UML diagrams, especially the **Sequence Diagram**, which will describe the interaction flow between objects.
- The relationships between classes (such as associations and responsibilities) were reviewed to ensure consistency and completeness.

Topics Discussed: Sequence Diagrams

The Sequence Diagram was presented to illustrate the step-by-step interaction between objects in the system.

It was highlighted that:

- The Sequence Diagram is based on the **Class Diagram**, using the same classes and relationships to show how objects communicate in real scenarios.
- It focuses on the **order of messages** exchanged between objects over time.
- Each interaction (message) represents a function or method defined in the Class Diagram.
- The diagram helps in understanding system behavior, especially during key processes like order placement and payment.

Additionally:

- Lifelines, messages, and activation bars were used to clearly represent interactions.
- The diagram ensures that the system logic is complete and consistent with the defined classes.
- It helps developers visualize workflows and is useful for implementation and testing.

Decisions Made:

- It was decided to use **Sequence Diagrams** to represent the dynamic behavior of the system and to clearly illustrate interactions between users and system components.
- The team agreed that all Sequence Diagrams will be **based directly on the Class Diagram**, ensuring consistency between system structure and behavior.
- It was decided to focus on the **main use cases** for the initial set of diagrams:
 - User Registration & Login
 - Browse Restaurants & Menu
 - Place Order
 - Payment Processing
 - Order Delivery & Tracking
- The team agreed that each interaction shown in the Sequence Diagram must **correspond to methods defined in the Class Diagram**.
- It was decided to use **standard UML notation**, including lifelines, activation bars, and message arrows, to maintain clarity and professionalism.
- The level of detail will be **moderate**, focusing on key interactions without overcomplicating the diagrams.
- It was agreed that **system validation (e.g., payment confirmation, order status updates)** will be clearly represented in the diagrams.
- The team decided that Sequence Diagrams will be used as a **foundation for implementation and testing**, helping developers understand the flow of operations.
- It was agreed to ensure that all diagrams remain **aligned with the ER Diagram and overall system design**, maintaining consistency across all models.

Tasks were divided among the team members based on the Requirement Specification document for the Food Ordering and Delivery System project.

Arjola Sula – Class Diagram

Responsible for designing and finalizing the Class Diagram, including defining the main classes (Customer, Restaurant, Delivery, Admin), their attributes, methods, and relationships. Ensured alignment with system requirements and consistency with the ER Diagram.

Xhesika Toska- Sequence Diagrams

Responsible for presenting and developing Sequence Diagrams for **Use Cases 08–14**, covering the main system interactions from start to end. The work was based on the Class Diagram to ensure consistency and correct mapping of methods and interactions.

Aurelio Hysenaj- Sequence Diagrams

Responsible for presenting and developing Sequence Diagrams for **Use Cases 15–21**, covering the main system interactions from start to end. The work was based on the Class Diagram to ensure consistency and correct mapping of methods and interactions.

Erjus Allka- Sequence Diagrams

Responsible for presenting and developing Sequence Diagrams for **Use Cases 22–28**, covering the main system interactions from start to end. The work was based on the Class Diagram to ensure consistency and correct mapping of methods and interactions.

Klara Hysenaj- Sequence Diagrams

Responsible for presenting and developing Sequence Diagrams for **Use Cases 35–45**, covering the main system interactions from start to end. The work was based on the Class Diagram to ensure consistency and correct mapping of methods and interactions.

Time, Place, and Agenda for Next Meeting:

17/04/2026-A005

- The next meeting will focus on developing **BPMN diagrams** to model the business workflows of the system in a clear and standardized way.
- The team will also work on **Collaboration Diagrams**, which will illustrate how different system components and actors interact with each other, complementing the Sequence Diagrams.
