

Strategy Pattern

The Strategy Pattern helps the system use different payment methods without changing the main payment logic. In the food delivery system, this pattern is used to manage different payment methods such as Credit Card, PayPal, and Cash.

Justification

This pattern was chosen because the food delivery system supports multiple payment methods, including Credit Card, PayPal, and Cash, each with different payment processing logic. Using the Strategy Pattern allows each payment method to be implemented in a separate class while sharing the same interface. This makes the system more flexible, organized, and easier to maintain. It also avoids large if-else statements inside the **Payment** class and allows new payment methods to be added in the future without modifying the existing code structure.
